Assumptions, Estimates and Limitations

• Speeds are ESTIMATES derived from pixel displacement of tracked centroids, converted with a user-supplied calibration factor (pixels per metre).

• The calibration is a single scale factor and does not model perspective distortion, so accuracy degrades away from the calibration row.

• Vehicle counting is based on virtual-line crossings and tracking IDs; ID switches by the tracker can cause rare miscounts.

• Density thresholds (LOW <= 3, MEDIUM <= 8 active vehicles) are CONFIGURABLE, not measured.

• Congestion is flagged when active vehicles >= 6 AND average speed <= 12.0 km/h (CONFIGURABLE).

• Overspeed threshold = 60.0 km/h (CONFIGURABLE).

• Vehicle class names come from the YOLO COCO model and can be wrong under occlusion or poor lighting.
